

INTERNATIONAL
YEAR OF THE SALMON

Institute for the
Oceans and Fisheries

Illuminating the black box of North Pacific salmon food webs: identifying trophic pathways and interspecific competition through an ecosystem approach

Genyffer C. Troina, Evgeny A. Pakhomov, Aleksey Somov, Brian P. V. Hunt

Institute for the Oceans and Fisheries

University of British Columbia

Competition for food...

Sympatric species may co-occur
and succeed because they
consume different prey types

Not competing for resources

Competition for food...

Competing species
coexistence

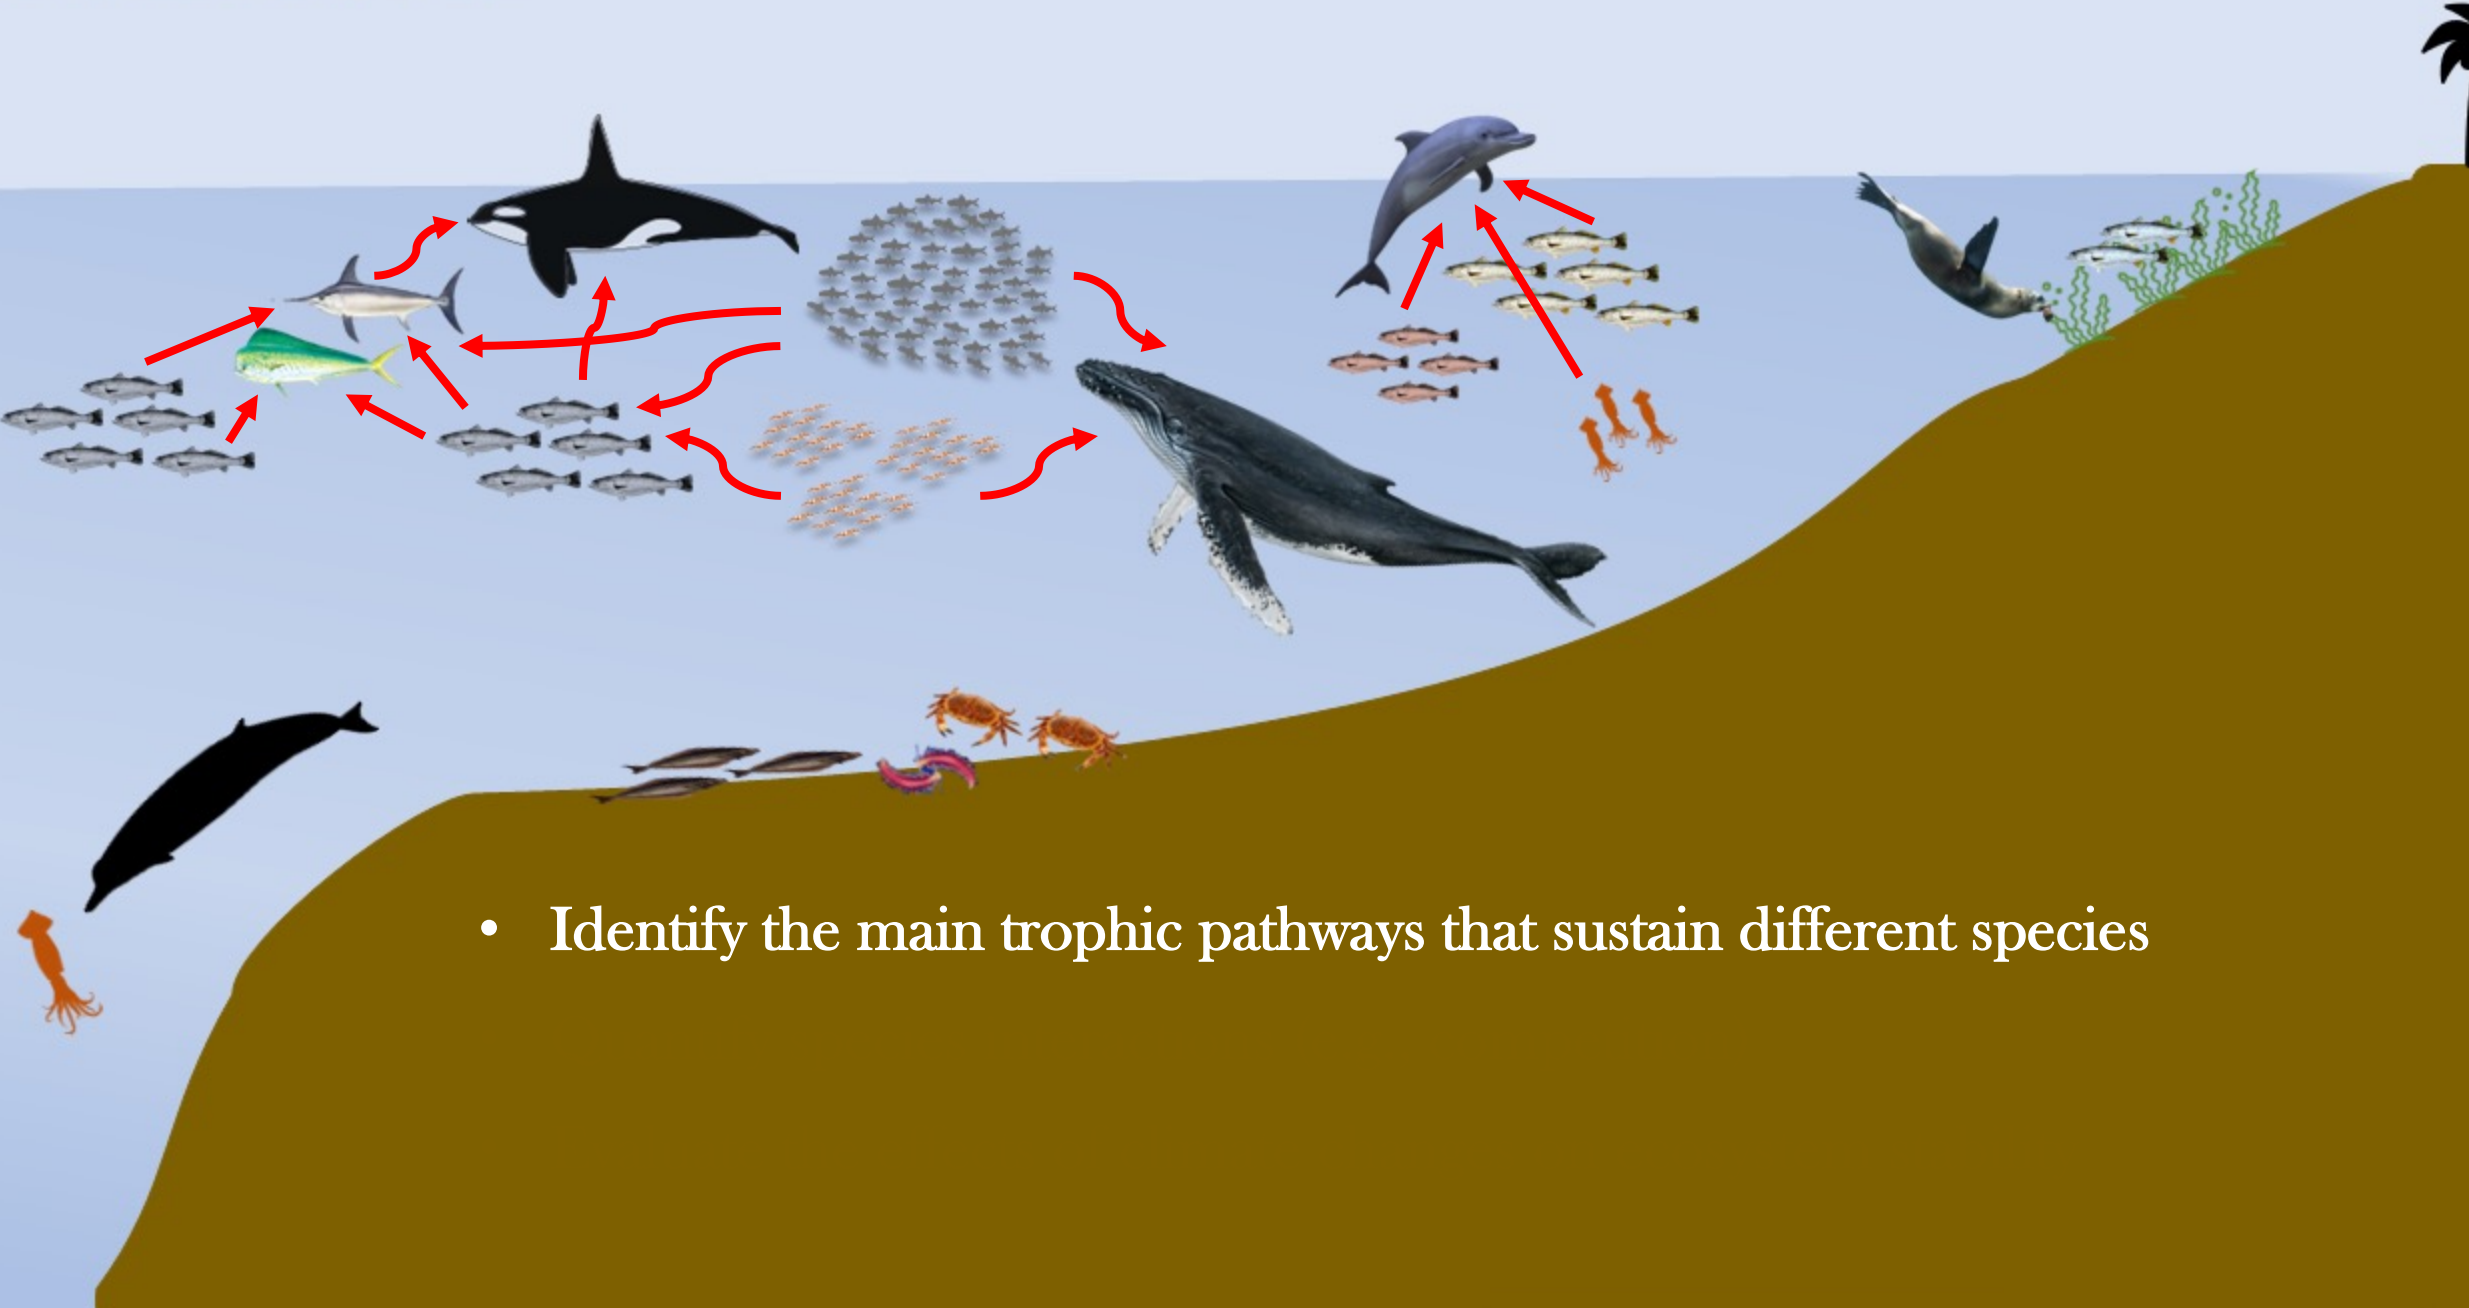

≠ spatial or temporal distributions at finer scales

Differential resource utilization

May affect species' reproduction success, growth and survival

Marine food webs

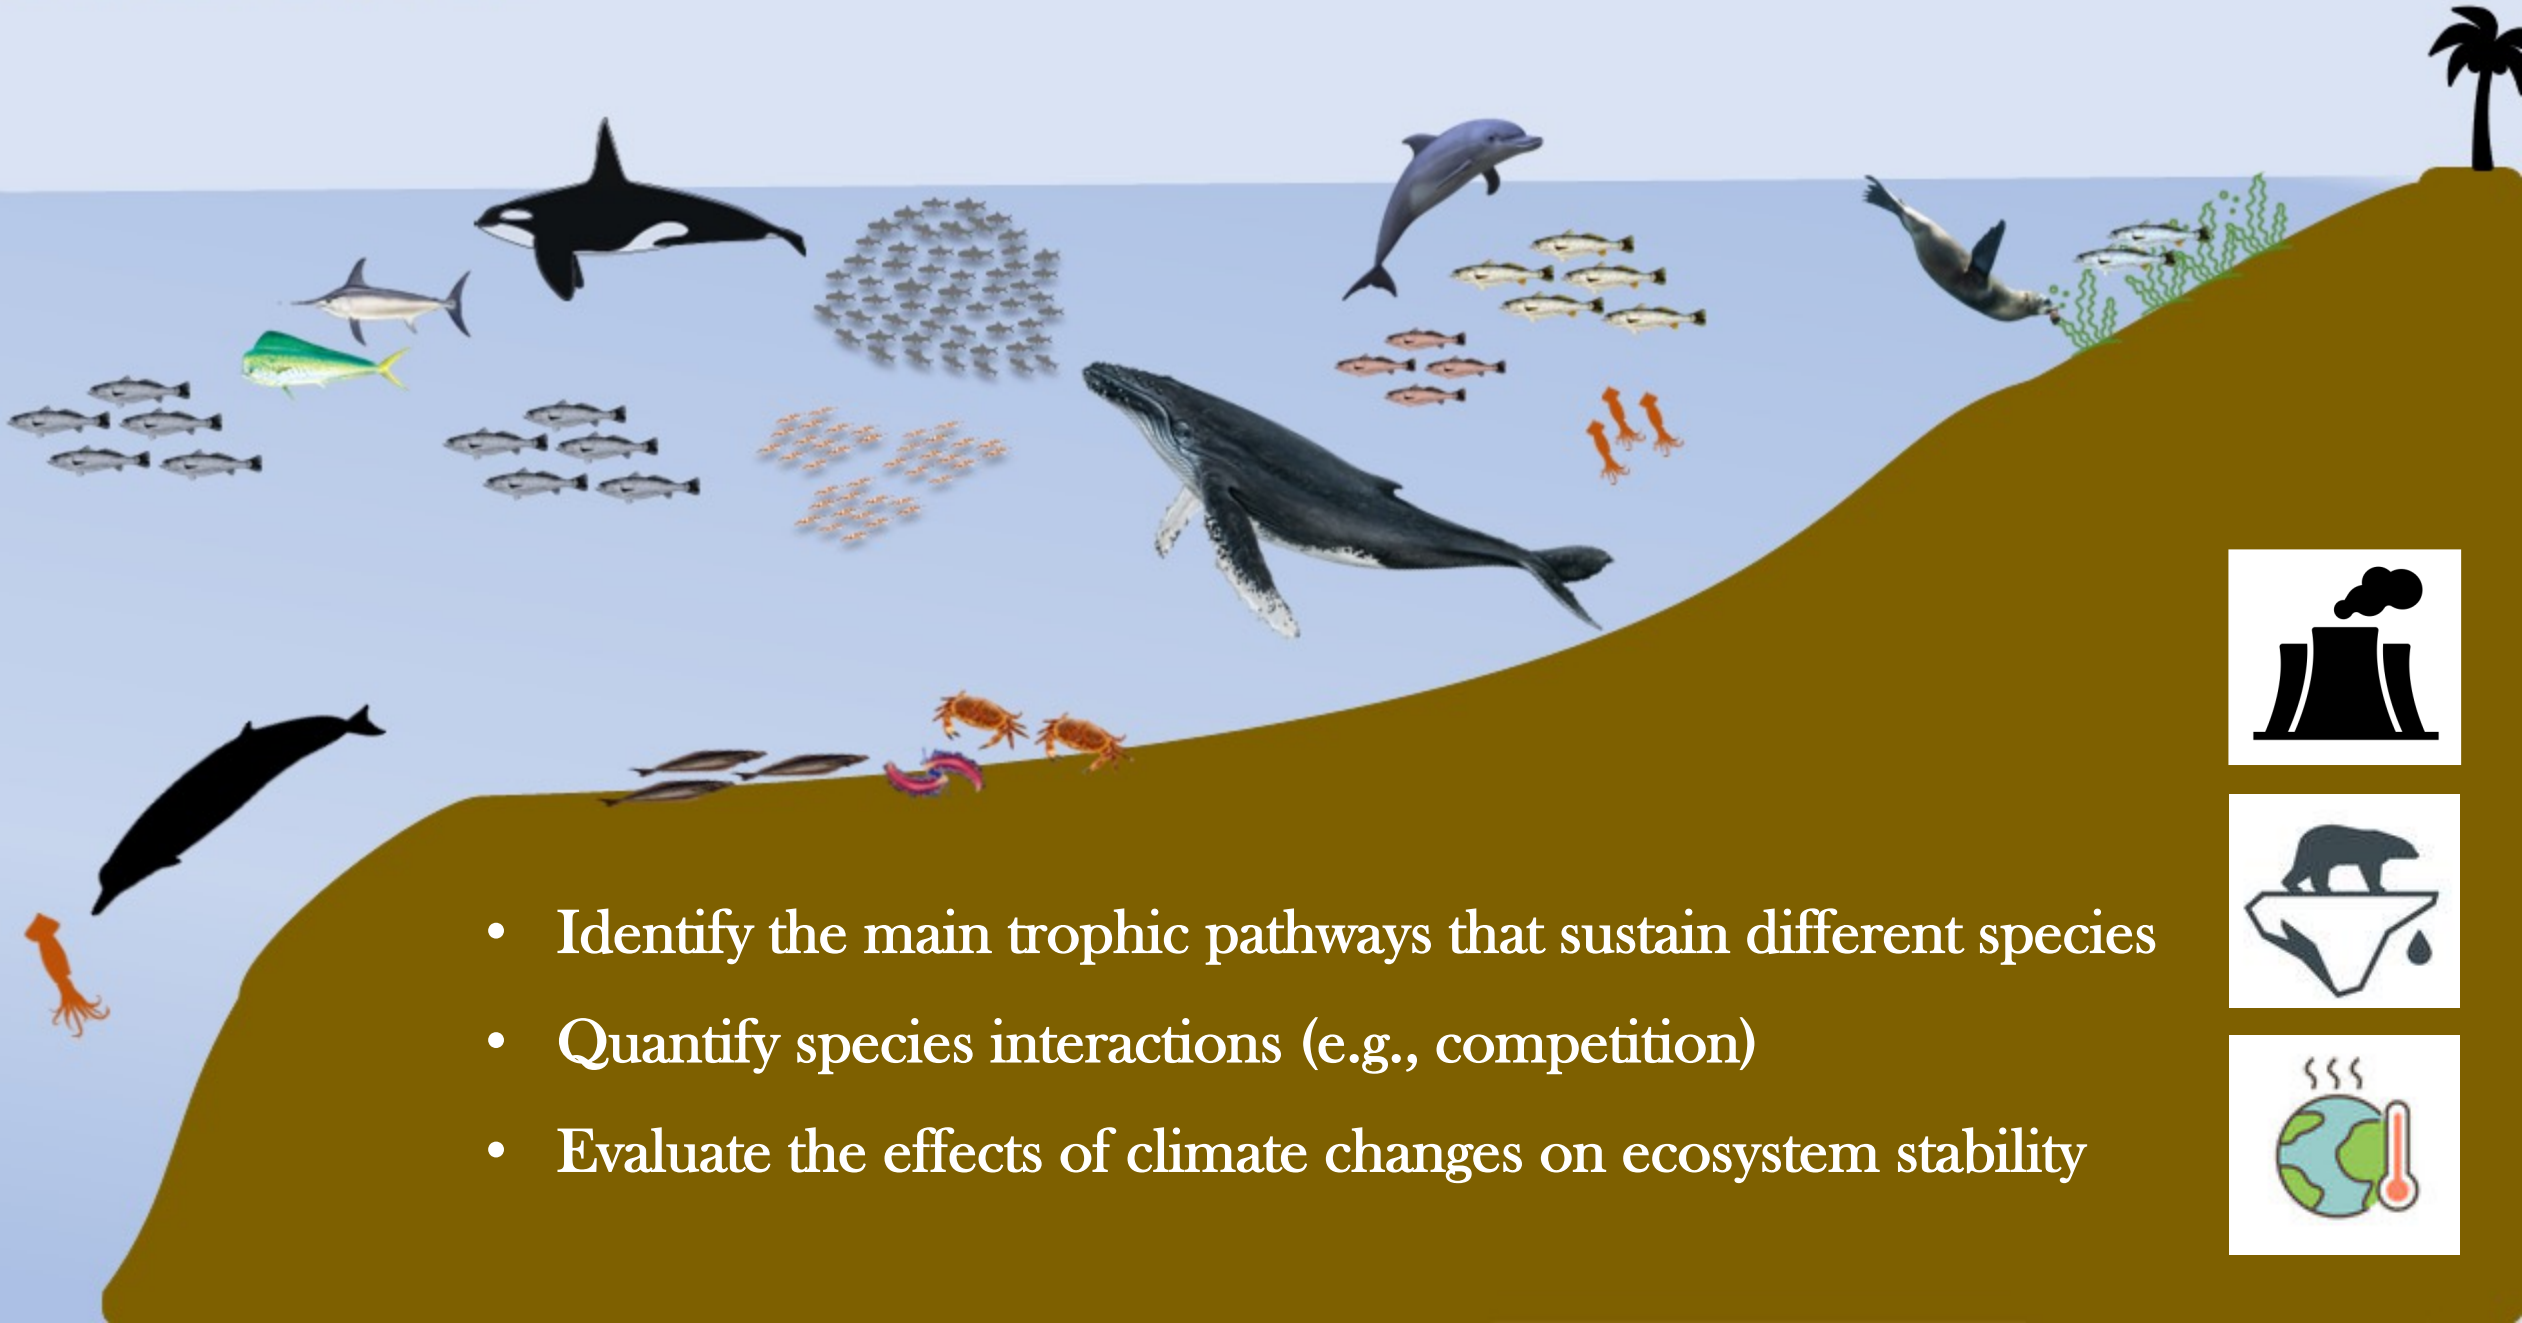

- Identify the main trophic pathways that sustain different species

Marine food webs

- Identify the main trophic pathways that sustain different species
- Quantify species interactions (e.g., competition)

Marine food webs

- Identify the main trophic pathways that sustain different species
- Quantify species interactions (e.g., competition)
- Evaluate the effects of climate changes on ecosystem stability

Pacific salmon life cycle

Pacific salmon life cycle

International Year of the Salmon

Offshore

Salmon life cycle image by Denis Dreves

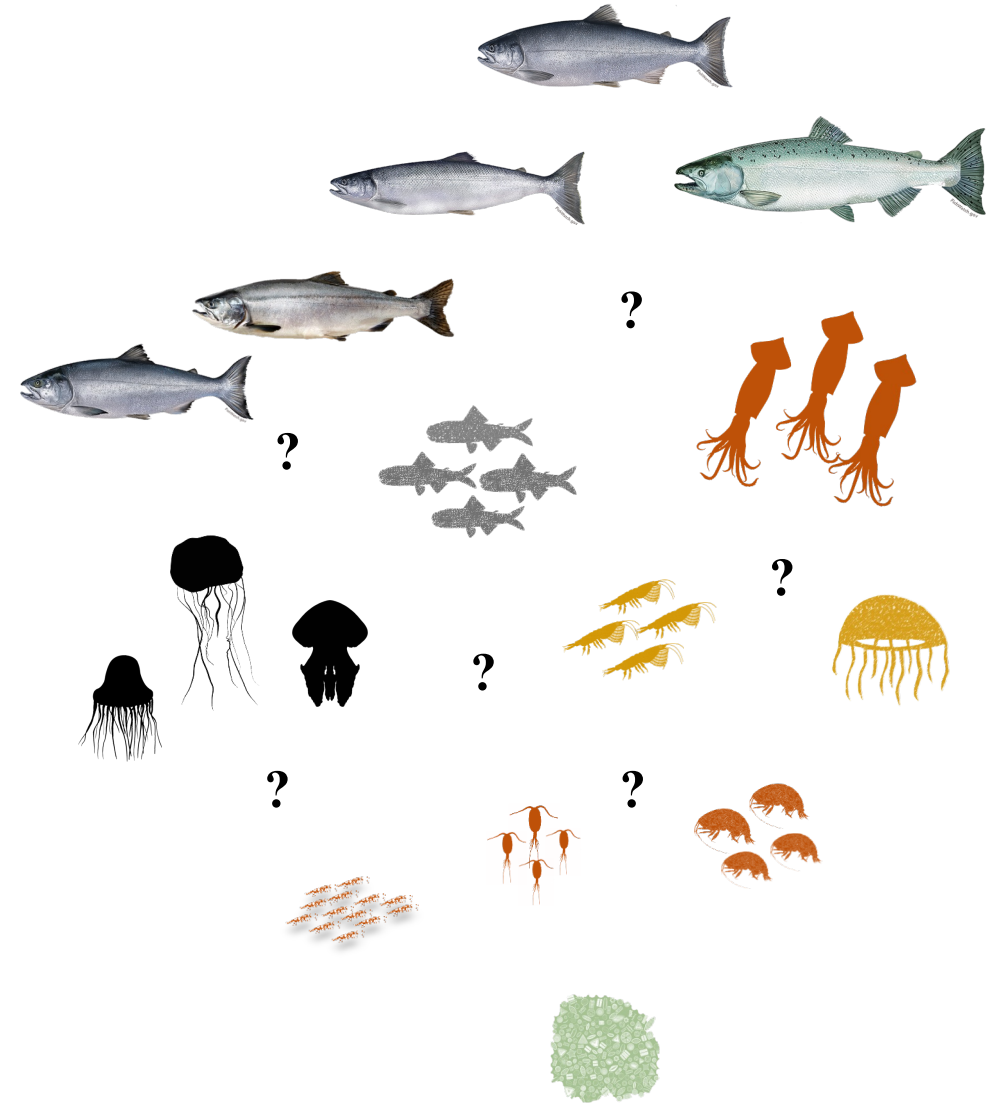

Objectives

- 1) Describe the trophic structure of the Gulf of Alaska pelagic food webs;
- 2) Identify species that compete with salmon for resources in the high seas.

Diet (stomach contents)

Stable isotopes ($\delta^{13}\text{C}$ & $\delta^{15}\text{N}$)

“You are what you eat”

Stable Isotopes

“You are what you eat” plus a few per mille...

- TL differences:
 - $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ increase with each increase in TL;

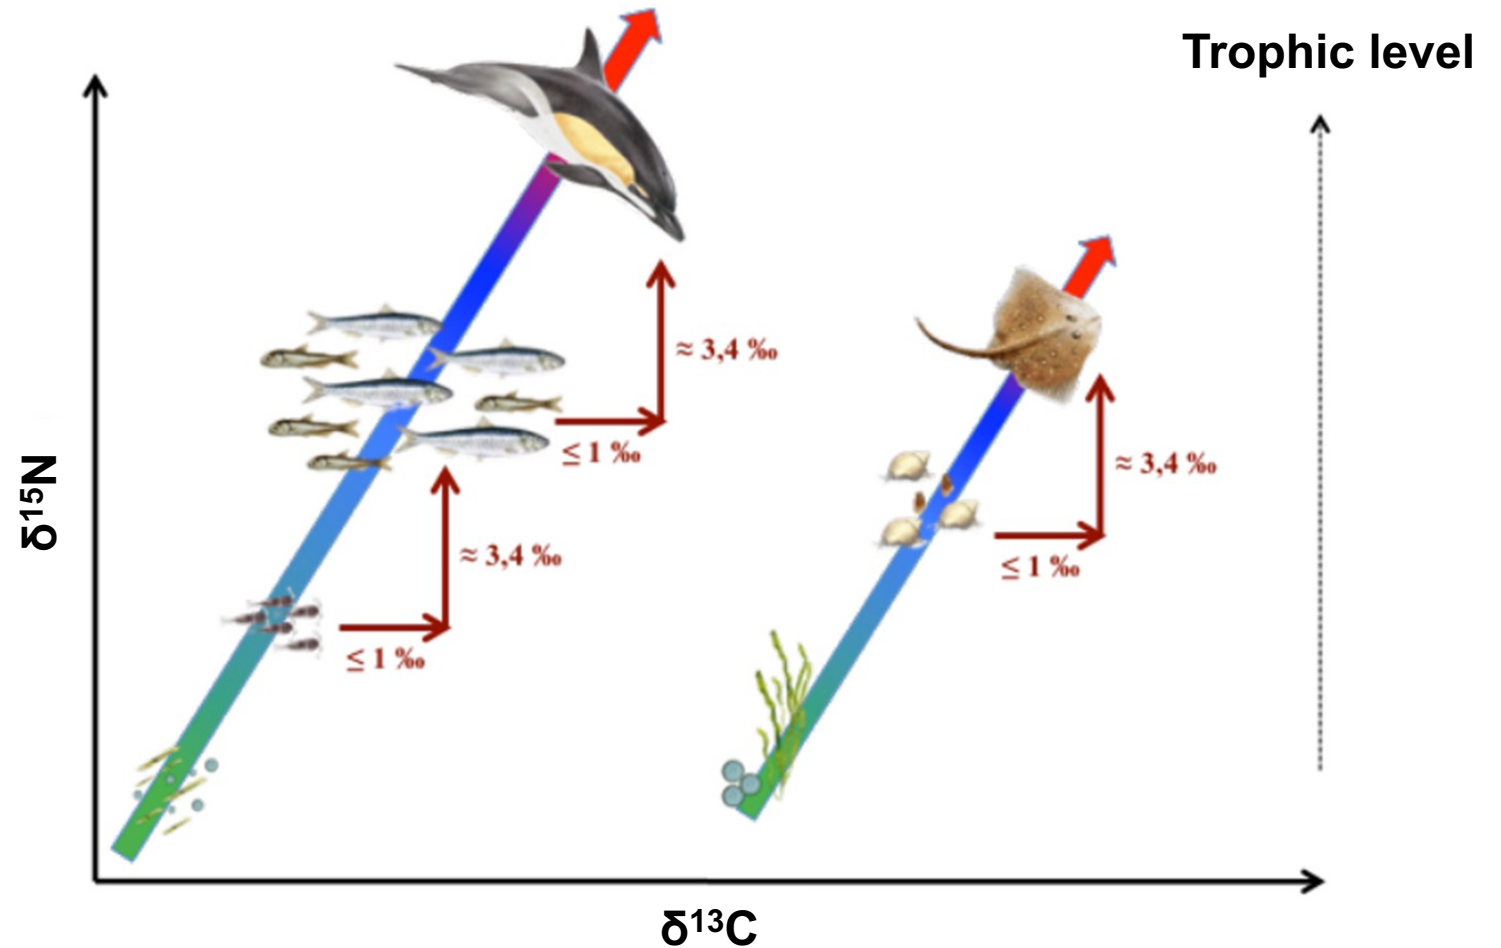

Discrimination during metabolic processes

Stable Isotope Analysis

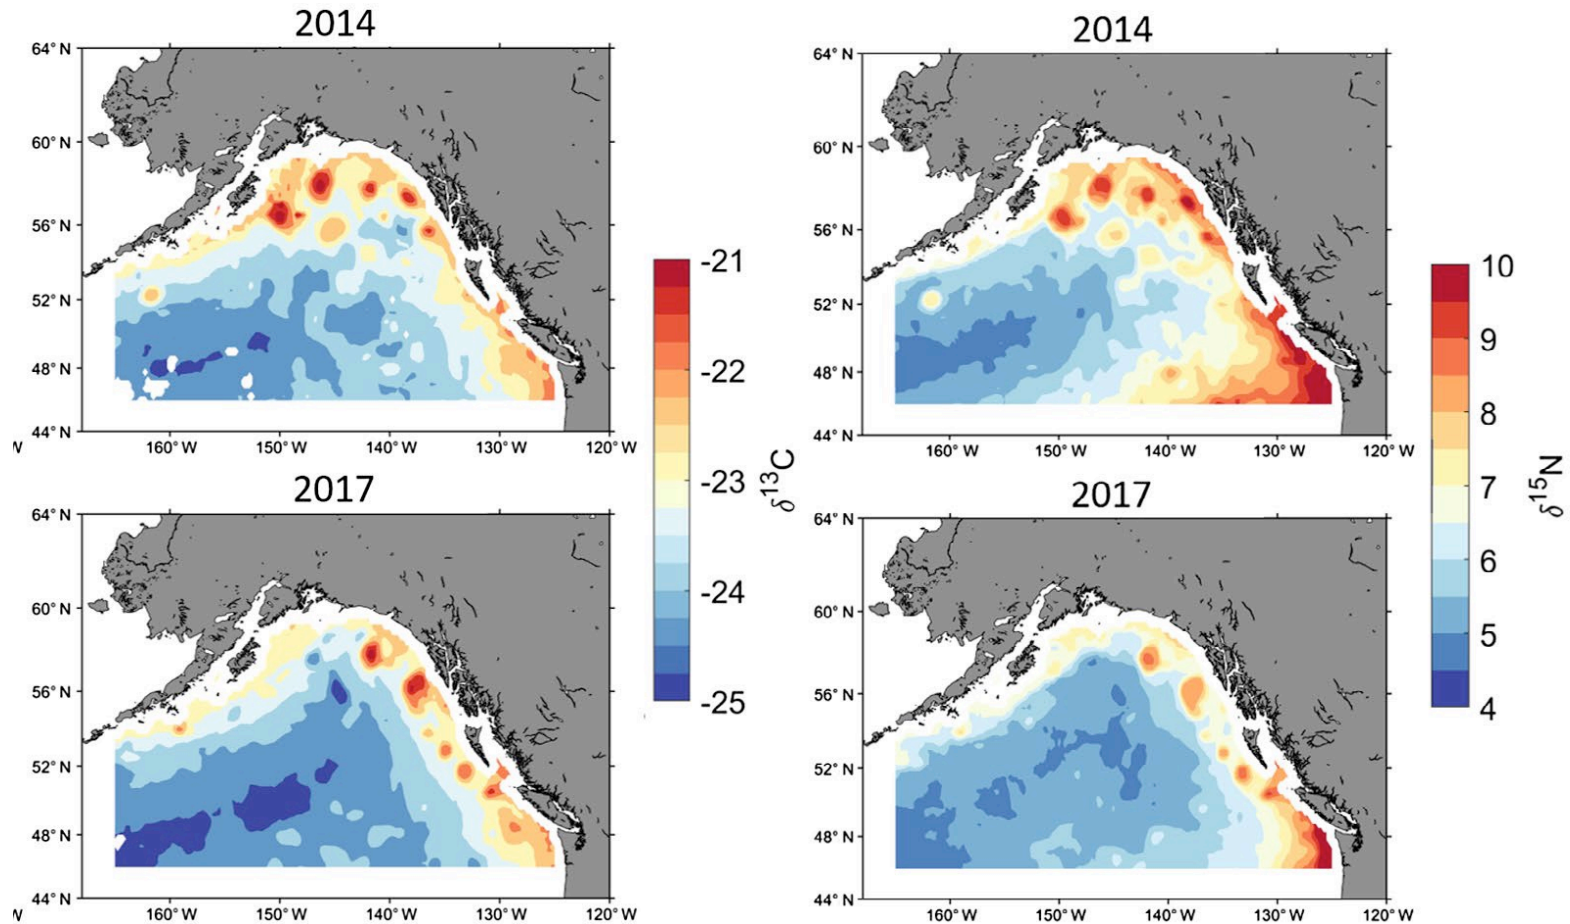

“You are what you eat” *plus a few per mille...*

- TL differences:
 - $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ increase with each increase in TL;

Stable Isotope Analysis

- TL differences:
 - $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ increase with each increase in TL;
- Spatial gradient:
 - Temperature, type of nutrient and primary producer species $\rightarrow \neq \delta^{13}\text{C}$ & $\delta^{15}\text{N}$

International Year of the Salmon - 2019

- Salmon: Coho, Chum, Pink, Sockeye & Chinook
- Particulate organic matter (POM)
- Zooplankton (size-fraction)
- Jellyfish, squids, & non-salmonid fish

Gulf of Alaska (GoA)

Subareas - hierarchical cluster analysis (oceanography data)

NW-GoA

↓ Temperature

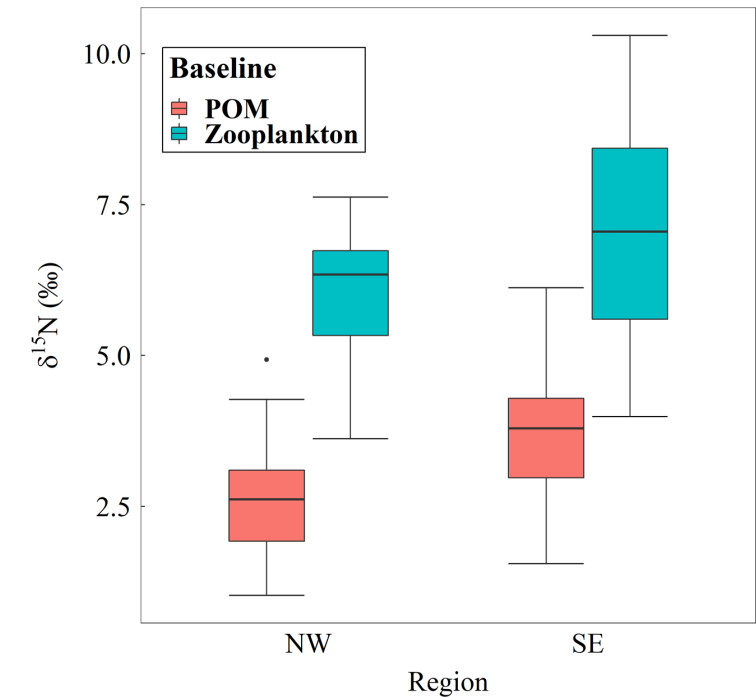

↑ Salinity

Temperature

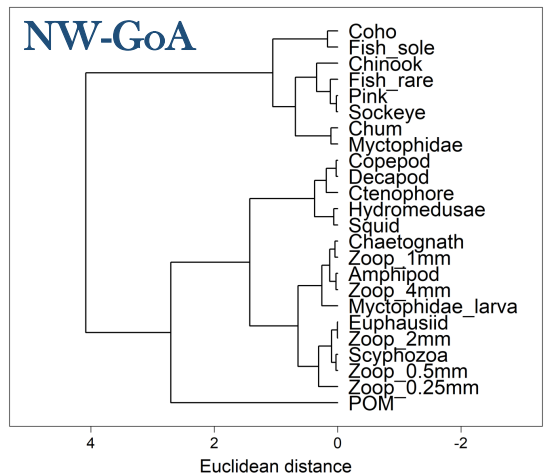

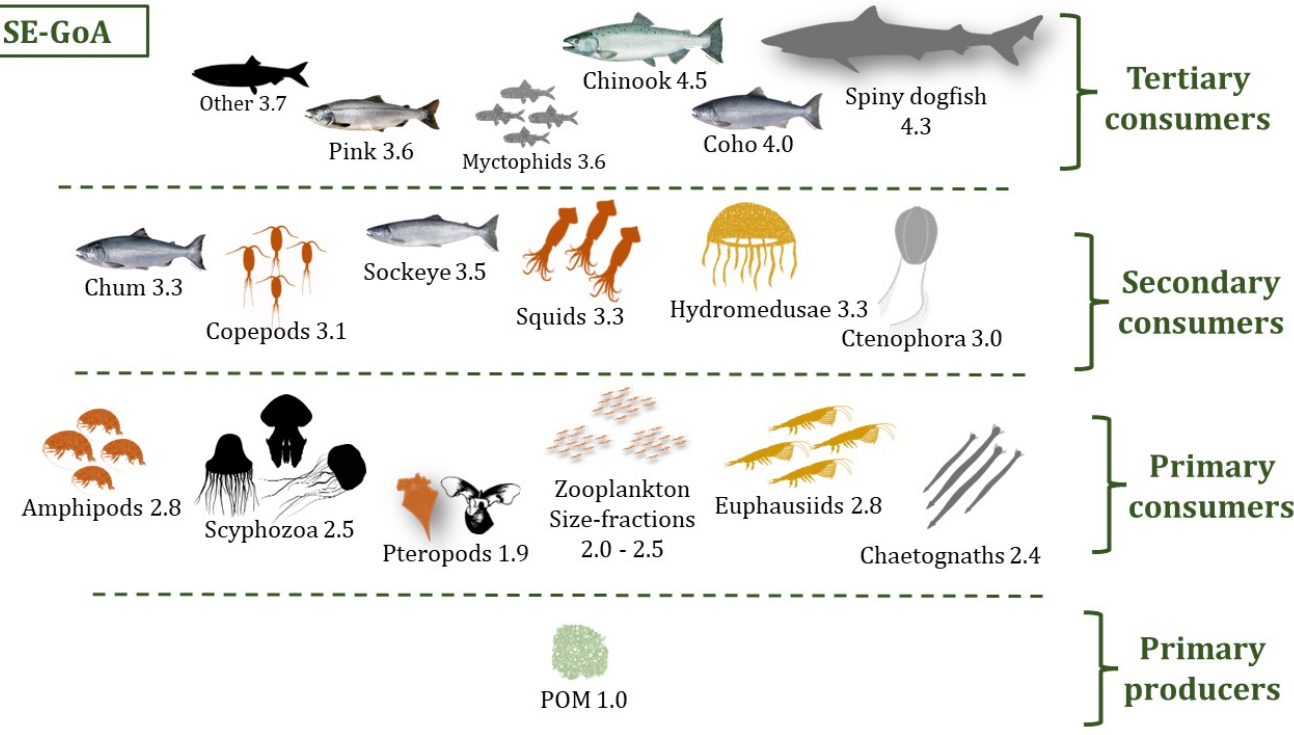

Food web structure - Trophic positions

NW-GoA

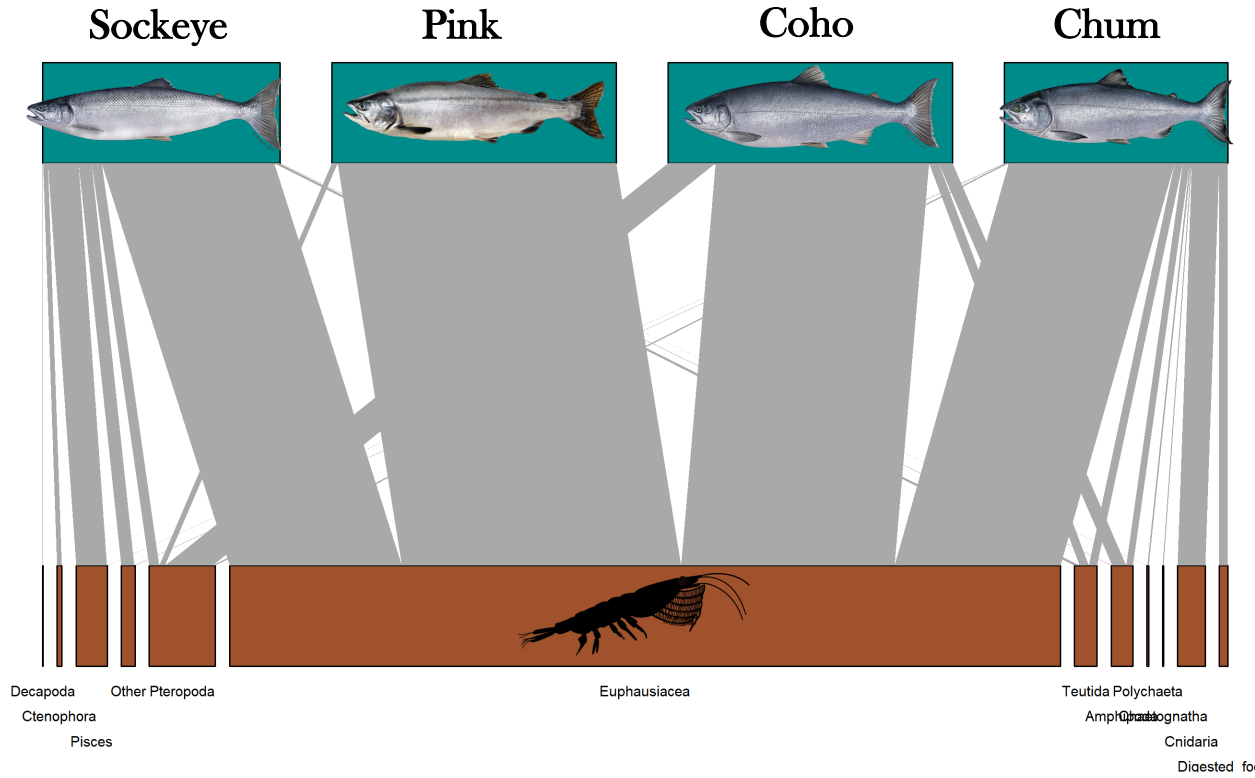

$$TP = \frac{(\delta^{15}N_{consumer} - \delta^{15}N_{Baseline}) + 1}{TEF}$$

SE-GoA

Salmon diet - Stomach content data

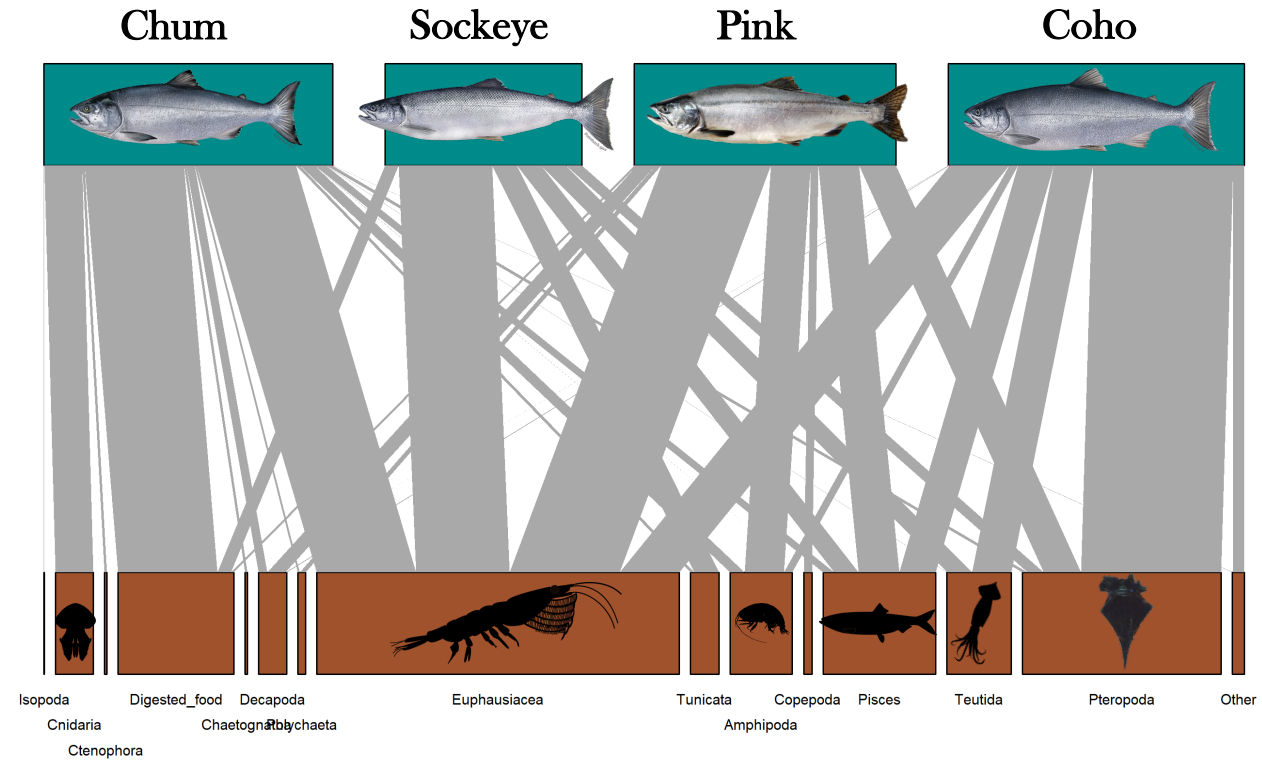

NW-GoA

NW-GoA - 60 - 75% krill

- SE-GoA krill ↘ 30-35%
- ↗ consumption of:
 - Pteropods - Coho, Pink salmon
 - Cnidaria - Chum salmon
 - Fish - Sockeye, Pink salmon
 - Amphipods - Pink salmon

SE-GoA

Trophic pathways - NW-GoA

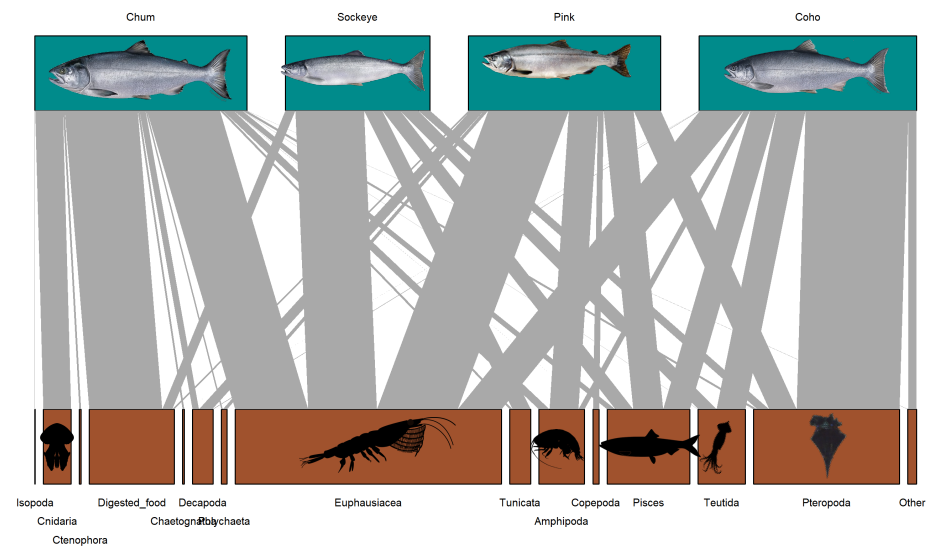

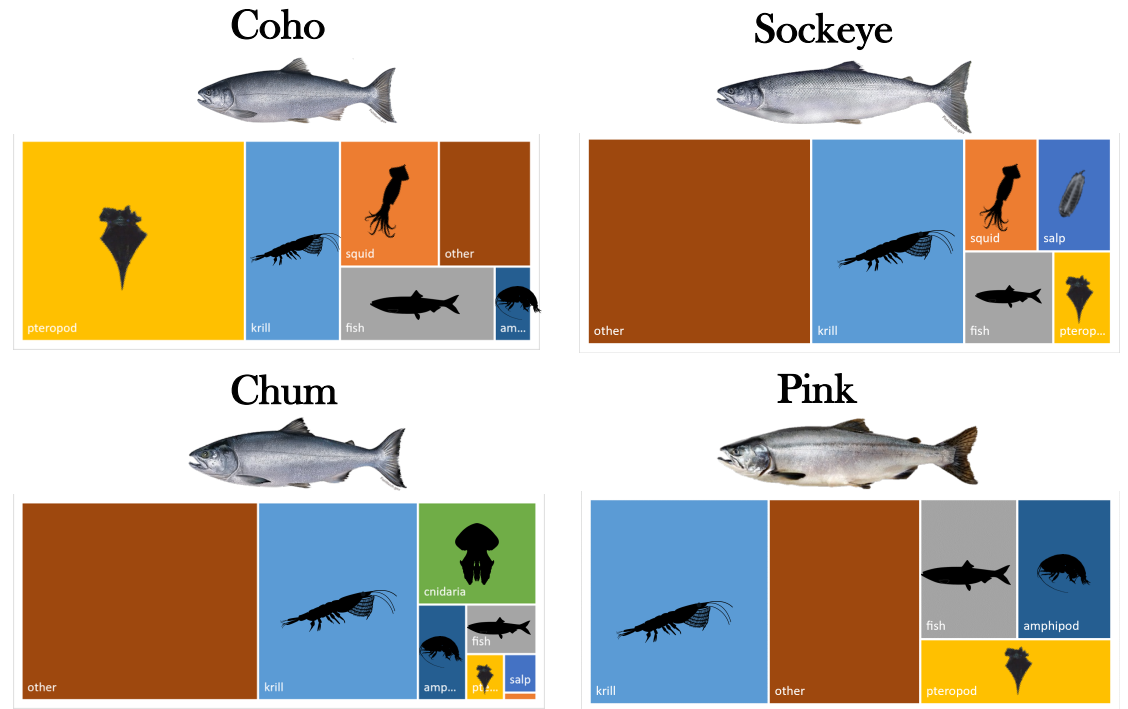

NW-GoA - 60 - 75% krill

Main pathway between phytoplankton and salmon

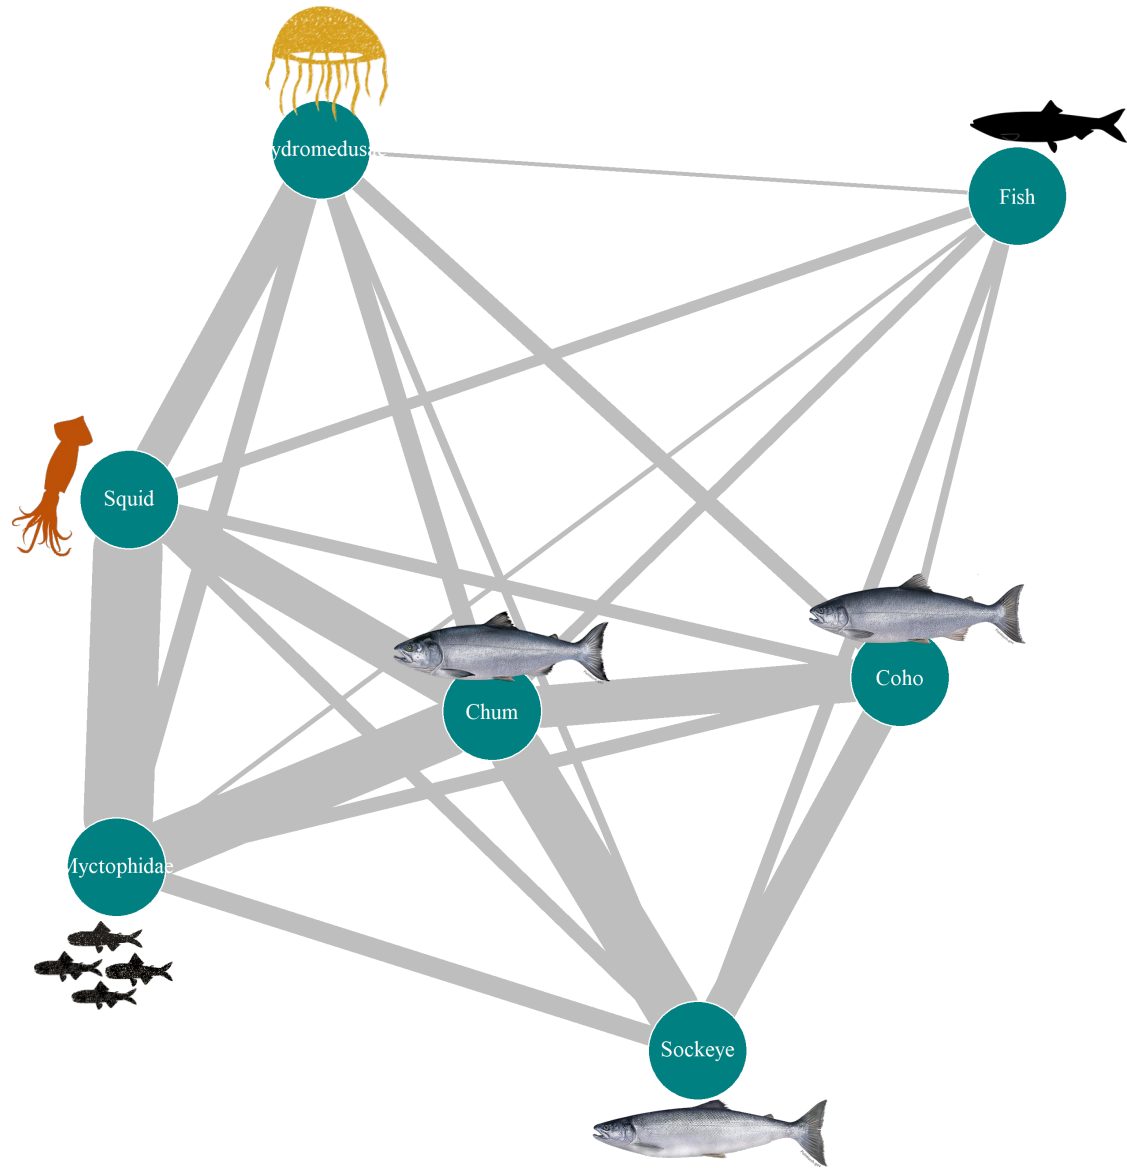

Trophic pathways - SE-GoA

SE-GoA

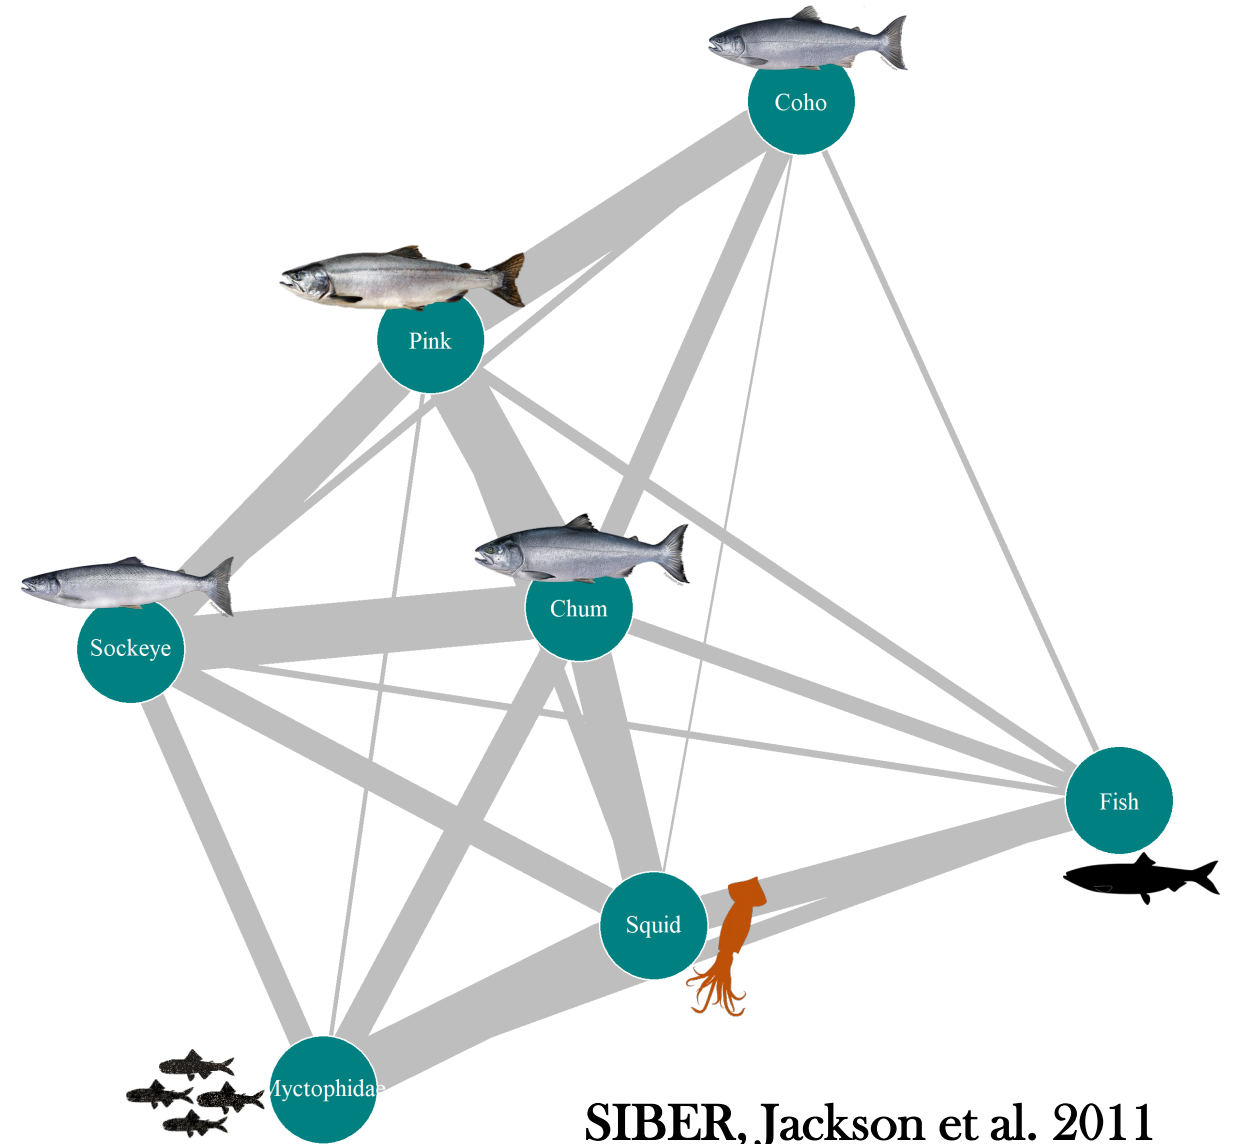

In the SE-GoA salmon consumed a greater diversity of prey

NW-GoA

Main takeaways

- Describe the trophic structure of the Gulf of Alaska pelagic food webs:
 1. Oceanographic gradients (NW-SE) → gradients in food web structure & main prey consumed by different salmon species;
 2. Food web less efficient in the SE-GoA - **Total & Salmon biomass** ↑ NW-GoA

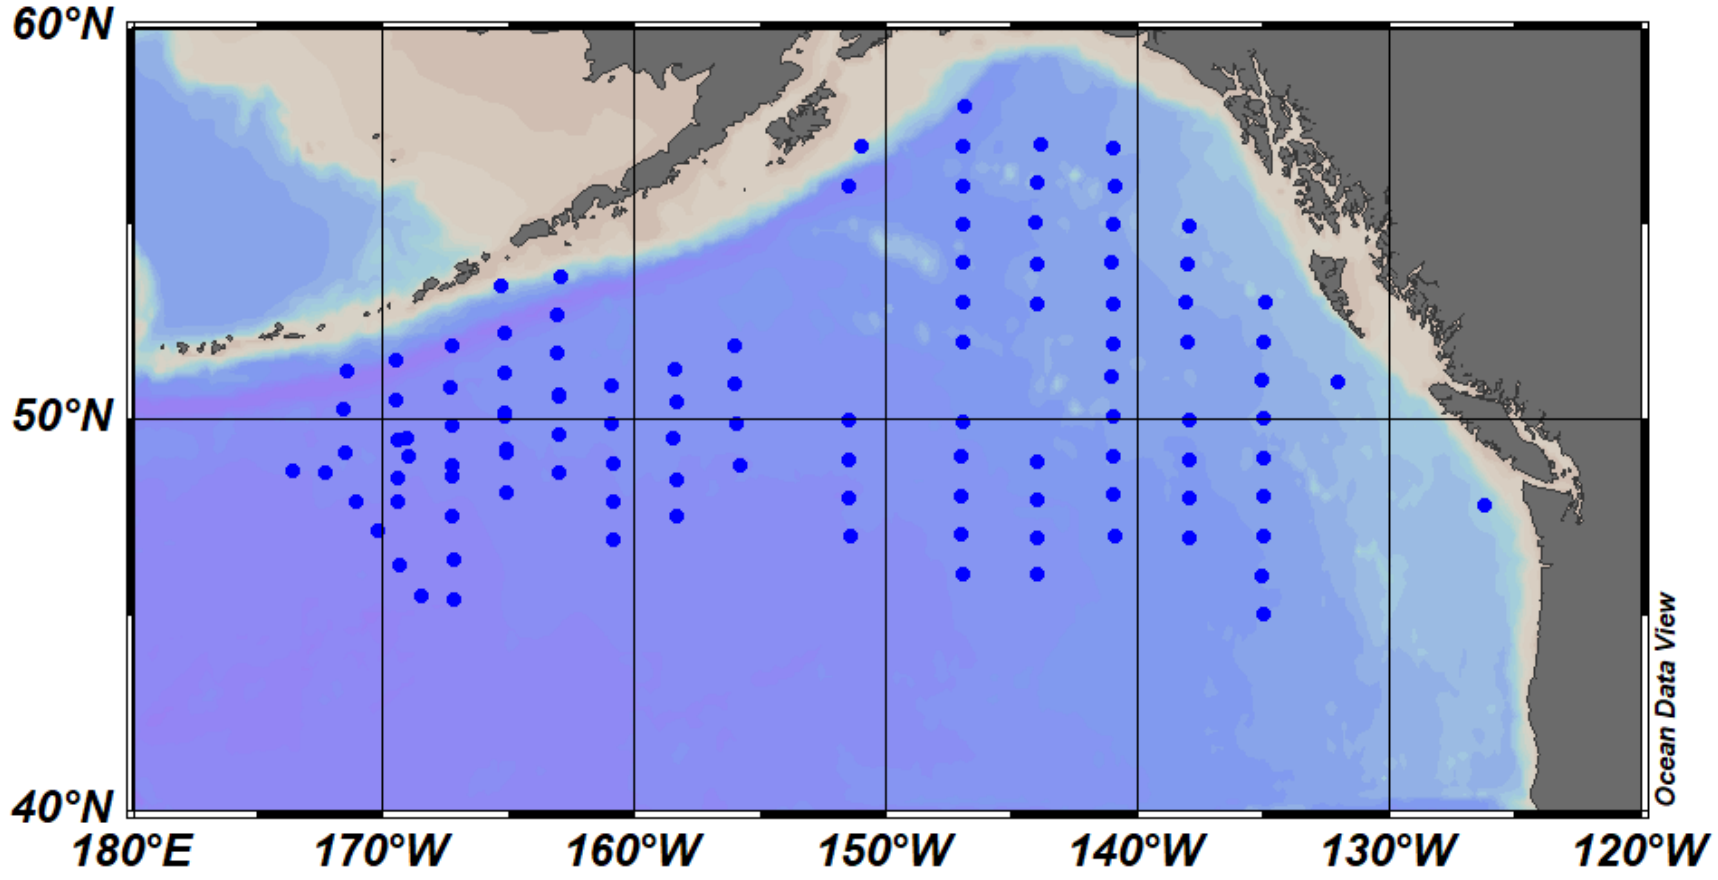

Total = micronekton + salmon

Main takeaways

- Describe the trophic structure of the Gulf of Alaska pelagic food webs:
 1. Oceanographic gradients (NW-SE) → gradients in food web structure & main prey consumed by different salmon species;
 2. Food web less efficient in the SE-GoA - **Total & Salmon biomass** ↑ NW-GoA

- Identify species that compete with salmon for resources in the high seas:
 1. Chum salmon compete with other salmon, squids and myctophids in both regions
 2. Pink salmon compete with all other salmon species (SE-GoA)
 3. Coho salmon: competition (for krill) in the NW-GoA but not in the SE-GoA - consuming more pteropods and higher biomasses
 4. Sockeye high competition & lower food web efficiency in the SE-GoA → preference for NW region

IYS 2022 - Pan-Pacific expeditions
